3ConnectIT

Introducing our digital services

3ConnectIT – Sync device data automatically

Asset View API gives you a seamless connection between our asset management platform and your in-house systems. It's the first API in the 3ConnectIT API library and provides you with a single source of the truth when it comes to your device data.

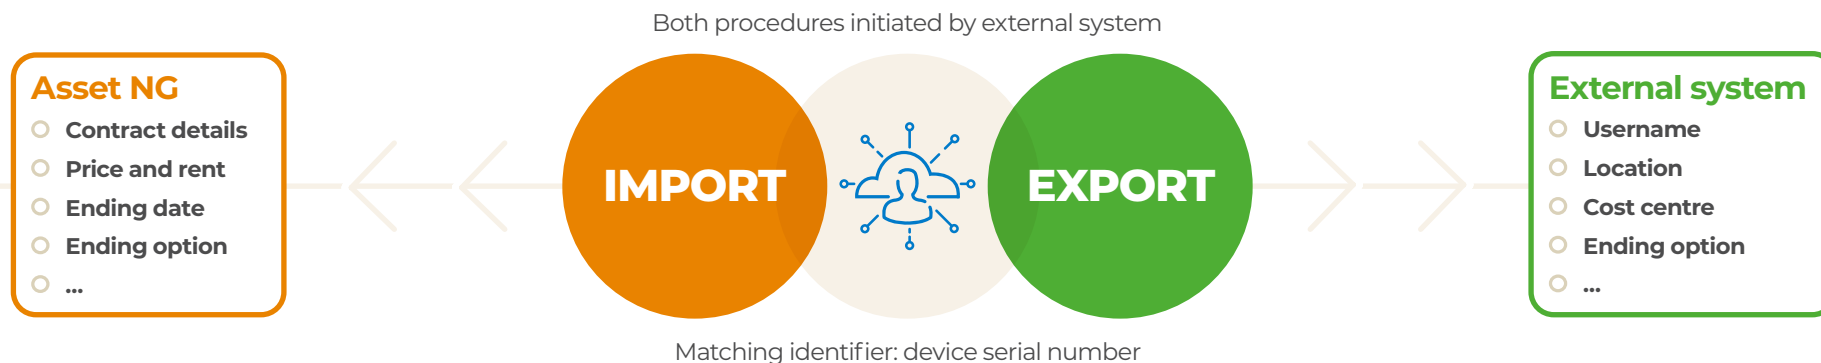

Even with a comprehensive asset management platform, managing your IT equipment can still present challenges. Often, you'll need to operate multiple systems to manage procurement, inventory, device diagnostics and billing, to name but a few key IT processes. This leaves data scattered and mismatched, making it difficult to draw quick, meaningful conclusions into your IT environment. Keeping data up to date as things change can become a burden, while manually updating data can introduce errors.

Key benefits

- Data aggregated into one system in real-time allows informed decision-making
- Assured data accuracy enables better use of data and makes it easier to track and trace devices
- Automated data transfer saves operational costs and time

How it works

The Asset View API is an interface to your device information in our asset management platform – Asset NG.

How it works

You'll have access to tools and online technical assistance to simplify the API integration process between your systems and our platform. Additionally, we'll partner with you to define the data transfer logic and offer ongoing support throughout the development process, including testing to ensure successful data transfer before go-live.

What to use the API for

The API can be used to connect with your IT service management systems, which typically hold device user and technical information. Contract and financial information from the asset management platform can also be fed to your systems.

Technical specifications

- Modern REST API using OAuth 2.0 authentication protocol
- Supports 79 device data fields including company, contract, financial and technical information
- Data transfer in JSON format with secured HTTP request method

By consolidating data between multiple systems using the **3ConnectIT API**, you're on your way to a **simpler and more efficient way** to manage your complex IT environment. **Speak to your account manager to find out more.**
