

Asset NG knows when, where, what, and how much

Asset NG is an asset management system optimised for IT lifecycle management. Its automated processes help manage the acquisition, use and renewal of IT assets.

The service helps allocate costs and control budgets and get the best out of installed technology. All parties have the same view of each device, which helps to manage lease starting and ending events.

A tool for lifecycle management

Asset NG tracks an asset's life and provides an audit trail: see what's being acquired and accept deliveries; track asset use and allocate costs to projects or departments; share information across the organisation. As well as information for cost allocation and budgeting, Asset NG provides lease accounting and lease liability financial reports.

Towards the end of the asset's life, use Asset NG to manage return or extension. When the asset is returned, see what condition it was in and receive a detailed data erasure report to show compliance with data protection regulations.

Asset NG

Provide the foundation for IT lifecycle management

Service through the lifecycle

As a network grows, the task of tracking and managing devices grows with it. Keeping users happy while devices are refreshed is a continual challenge.

The Asset NG service starts as an asset arrives, making it easy to check and accept incoming acquisitions. This gives you control by ensuring the device

and user information are correct before formally start the lease agreement.

As a detailed equipment register is built up Asset NG offers basic, financial and technical views of the information, as well as a summary dashboard, with drill down to device level information.

Support the whole technology lifecycle

With a record of where devices are used, Asset NG provides financial reports with cost allocation summarised for a project or for departments e.g. by cost centre.

Asset NG shows lease ending dates for all devices to help plan device replacement or lease extensions, and for IT to schedule installation support resource. Using the service to communicate impending events, and the actions chosen helps you avoid

end of lease ambiguity and unintended lease extensions.

Once devices are returned, Asset NG holds data erasure reports and equipment quality records to support your security audits. Information on equipment quality can help you review the overall refresh plan: e.g. quality will fall if devices have been kept too long.

Provide reports for informed decisions

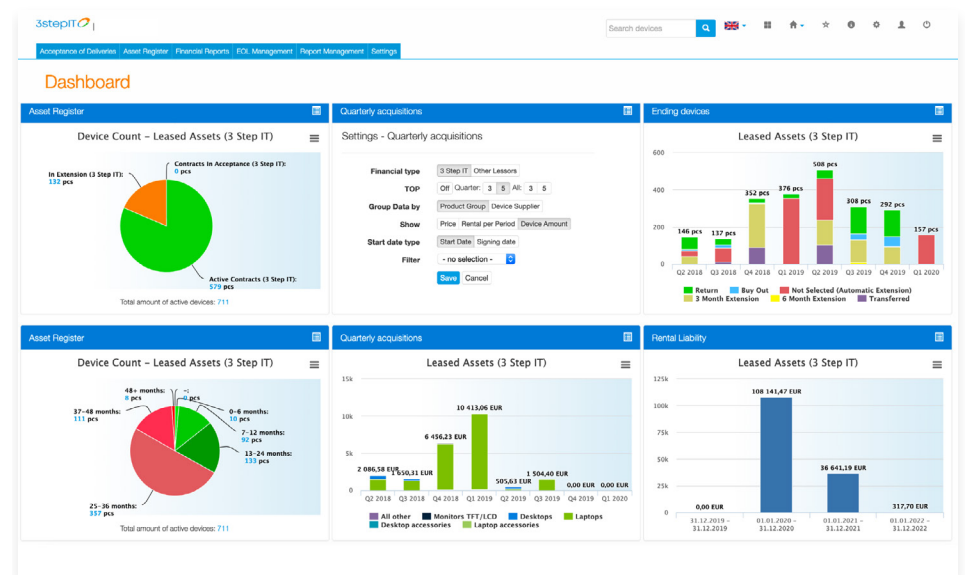

This view is an example of the possibilities: it shows the numbers of devices; value vs. age; value vs. type; quarterly acquisitions; aged view of devices and lease ending choices. To get more detailed information it is easy to drill down to individual devices.

This screenshot shows an asset management dashboard. The dashboard can be tailored:

To suit different user groups, so sensitive information can be kept confidential.

To match data shown to the task: e.g. finance needs a different view compared to IT support.
